## **Unit 06: Correlation, Regression and Analysis if Variance**

| 1. | The techniques which provide the decision maker a systematic and powerful means of Analysis to explore policies for achieving predetermined goals are called |                                |                       |                   |  |  |  |
|----|--|--------------------------------|-----------------------|-------------------|--|--|--|
|    | Correlation techniques   | Mathematical                   | Quantitative          | None of the above |  |  |  |
|    |  | techniques                     | techniques            |                   |  |  |  |
| 2. | Correlation analysis is a  |                                |                       |                   |  |  |  |
|    | Univariate analysis  | Bivariate analysis             | Multivariate analysis | B and C           |  |  |  |
| 3. | If change in one variable results a corresponding change in the other variable, then the variables are   |                                |                       |                   |  |  |  |
|    | Correlated   | Not correlated                 | Any of the above      | None of the above |  |  |  |
| 4. | When the values of two variables move in the same direction, correlation is said to be   |                                |                       |                   |  |  |  |
|    | Linear   | Non-linear                     | Positive              | Negative          |  |  |  |
| 5. | When the values of two variables move in the opposite directions, correlation is said to be  |                                |                       |                   |  |  |  |
|    | Linear   | Non-linear                     | Positive              | Negative          |  |  |  |
| 6. | When the amount of change in one variable leads to a constant ratio of change in the other variable, then correlation is said to be                          |                                |                       |                   |  |  |  |
|    | Linear   | Non-linear                     | Positive              | Negative          |  |  |  |
| 7. | attempts to determine the degree of relationship between variables.  |                                |                       |                   |  |  |  |
|    | Regression analysis  | Correlation analysis           | Inferential analysis  | None of these     |  |  |  |
| 8. | Non-linear correlation is also called  |                                |                       |                   |  |  |  |
|    | Non-curvy linear   | Curvy linear                   | Zero correlation      | None of these     |  |  |  |
|    | correlation  | correlation                    |                       |                   |  |  |  |
| 9. | If all the points of a scatter diagram lie on a straight line falling from left upper corner to the right bottom corner, the correlation is called           |                                |                       |                   |  |  |  |
|    | Zero correlation   | High degree of positive        | Perfect negative      | Perfect positive  |  |  |  |
|    |  | correlation                    | correlation           | correlation       |  |  |  |
| 10 | The variable whose value   | e is influenced or is to be pr | edicted is called     |                   |  |  |  |

|  | Dependent variable.   | Independent variable       | Both of these | None of these |  |  |  |
|--|---|----------------------------|---------------|---------------|--|--|--|
| 11.  | 11. The variable which influences the values or is used for prediction is called  |                            |               |               |  |  |  |
|  | Dependent variable.   | Independent variable       | Both of these | None of these |  |  |  |
| 12.  | 2. In this equation $Y = \beta_0 + \beta_1 XY$ is   |                            |               |               |  |  |  |
|  | Dependent variable.   | Independent variable       | Both of these | None of these |  |  |  |
| 13. In this equation $Y = \beta_0 + \beta_1 X$   |   |                            |               |               |  |  |  |
|  | Dependent variable.   | Independent variable       | Both of these | None of these |  |  |  |
| 14.  | 14. Statistical technique specially designed to test whether the <u>means</u> of more than 2 quantitative populations are equal.                |                            |               |               |  |  |  |
|  | Anova   | Coorelation                | Regression    | None of these |  |  |  |
| 15.  | Thein ANOVA is valid when all the sample means are equal, or they don't have any significant difference.  |                            |               |               |  |  |  |
|  | Null hypothesis   | Alternate hypothesis       | Both of these | None of these |  |  |  |
| 16.  | 16is a function that allows an analyst to make predictions about one variable based on the information that is known about another one variable |                            |               |               |  |  |  |
|  | Simple linear   | Multiple linear            | Multilinker   | None of these |  |  |  |
|  | regression  | regression                 |               |               |  |  |  |
| 17is a function that allows an analyst to make predictions about one variable based on the information of another three variables. |   |                            |               |               |  |  |  |
|  | Simple linear regression  | Multiple linear regression | Multilinker   | None of these |  |  |  |
